

Assignment 06

Task 1: Prompt Categorization

1. "Generate a logo for a tech startup using neon colors."

- Type: Visual / Creative
- Reasoning: The prompt asks for a graphic output (a logo). It specifies style (neon colors) but not textual explanation, so it clearly belongs to the visual content generation category.

2. "Explain blockchain to a 5-year-old."

- Type: Instructional / Educational
- Reasoning: The prompt asks for a simplified teaching explanation. It is aimed at making a complex concept easy to understand for a child, so this is instructional in nature.

3. "You are a UX designer. Suggest improvements to this app layout."

- Type: Conversational / Advisory
- Reasoning: The prompt assigns a role (UX designer) and requests expert suggestions. It is not asking for a direct creation (like an image) but rather professional advice in a conversational style.

Task 2: Refinement Practice

1. Original: "Write a story."

Refined: "Write a 600-word fantasy story for teenagers about a young wizard who discovers a hidden city under the ocean. Include elements of friendship, adventure, and a surprising twist at the end."

2. Original: "Draw a tree."

Refined: "Generate an image of a large oak tree in autumn, with golden and red leaves, roots partly visible above the soil, and a soft sunset sky in the background."

3. Original: "Explain AI."

Refined: "Explain artificial intelligence to a high school student in simple language. Use real-life examples like virtual assistants (Siri, Alexa) and Netflix recommendations to make it relatable."

4. Original: "Create a recipe."

Refined: "Create a healthy vegetarian pasta recipe that takes less than 30 minutes to prepare, uses common household ingredients, and includes step-by-step instructions with nutritional tips."

5. Original: "Design a website."

Refined: "Design a one-page website layout for a small bakery, featuring a warm pastel color theme, a hero image of fresh bread, sections for menu, testimonials, and an online order button."

Task 3: Prompt Design Exercise

1. ChatGPT (text-based) Prompt:

“Act as a travel guide. Suggest a 3-day itinerary for Paris for first-time visitors, including must-see attractions, local food recommendations, and budget-friendly tips.”

Why effective? It gives role, purpose, timeline (3 days), audience (first-time visitors), and constraints (budget-friendly).

2. DALL·E (image-based) Prompt:

“Generate an image of a futuristic library in cyberpunk style, with neon lighting, floating digital books, and people using holographic tablets.”

Why effective? Specifies subject (library), style (cyberpunk), visual elements (neon lights, holograms).

3. SORA (video-based) Prompt:

“Create a 30-second animated video showing the water cycle (evaporation, condensation, precipitation) in a fun, cartoon style with cheerful background music.”

Why effective? Provides topic (water cycle), length (30 sec), style (cartoon), and mood (cheerful).

4. Coding or Logic Prompt:

“Write a Python program that takes a list of numbers as input and returns the second largest number. Include comments explaining each step in the code.”

Why effective? Defines task (find second largest number), language (Python), and requirement (comments).

5. Education or Training Prompt:

“Design a 45-minute interactive training session for college students on time management skills, including 3 practical exercises, a group activity, and a short quiz.”

Why effective? Defines audience (college students), duration (45 minutes), method (interactive), and structure (exercises, group activity, quiz).

Practice Activity (Live Testing Plan)

- ChatGPT: Test text prompts (itinerary, Python code, training session) → Check if outputs are structured, clear, and useful.
- DALL-E: Test the visual prompt (library) → Check if output matches style and details.
- SORA: Test video prompt (water cycle) → Check if video includes all 3 stages + cheerful style.
- Canva AI / Other tools: Recreate poster or training visuals → Analyze clarity and attractiveness.
